

Heliport Facility and Training Manual

Developmental Training Aid

Next to design faults, the next most common cause of helicopter accidents at heliports is human error. Most of these errors could have been avoided with proper training and heliport operational knowledge. Protect your heliport operation with an individualized heliport training program, designed for your specific heliport.

The Heliport Facility and Training Manual Training Aid helps you develop a comprehensive safety training program for the operation of your hospital heliport. Developed by Raymond A. Syms and Associates, a leader in heliport design and implementation, the manual is designed to help qualified helicopter aviation professionals develop specific training materials for their own heliports and operations.

The manual includes the following samples: Pilot Briefing Sheet, Facility Information Sheet, Emergency Procedures and Notification Sheets, Campus Map with Labels, Security Policy, Heliport and Helicopter Safety and Training Program and checklist, and clear descriptions of departmental responsibilities and guidelines regarding the safe operation of a single-aircraft, rooftop heliport. A valuable inclusion to a Safety Management System, the manual gives particular attention to helicopter safety, downwash awareness and potential heliport hazards.

Don't let staff who are inexperienced around helicopters and heliports, or helicopter operators unfamiliar with your operation, put your heliport in jeopardy of an accident. For a complimentary copy of this guide or professional assistance in tailoring it to your heliports specific operations, please call 732-870-8883 or e-mail us at ray@raysyms.com.
